                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Sequence 17, Application US/09007005B
Patent No. 625858
GENERAL INPORMATION:
APPLICANT: SCOSTAK, Jack W.
APPLICANT: ROBETS, Richard W.
APPLICANT: LANDERSON SELECTION OF PROTEINS USING RNA-PROTEIN
TITLE OF INVENTION: 108108
FILE REPRESENCE: 00786/35003
CURRENT FILING DATE: 1998-01-14
EARLIER APPLICATION NUMBER: 60/035,963
EARLIER FILING DATE: 1998-01-27
EARLIER FILING DATE: 1997-11-06
SOFTWARR: FASTSEQ for Windows Version 4.0
ELECTHIC 289
LENGTH: 289
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Sequence 17, Application US/09244796
Patent No. 6281344
GENERAL INFORMATION:
APPLICANT: SZOSTAK, Jack W.
APPLICANT: SZOSTAK, Jack W.
APPLICANT: Roberts, Richard W.
APPLICANT: Liu, Rihe
ITILE OF INVENTION: SELECTION OF PROTEINS USING RNA-PROTEIN
TITLE OF INVENTION: SOUSONS
FILE REPERRNE: 00786/350007
CURRENT APPLICATION NUMBER: US/09/244,796
CURRENT FILING DATE: 1999-02-05

New dystrophin minigene for treating Duchenne or Becker muscular dystrophy comprises an N-terminal domain or modified N-terminal domain,

The present invention relates to an isolated nucleotide sequence encoding a dystrophin minigene. The minigene comprises N-terminal or modified N-terminal domains, rod repeats, utrophin or a spectrin gene, HI and H4 whether and cysteine-rich domains of dystrophin or utrophin genes. The domains and cysteine-rich domains of dystrophin or utrophin genes. The invention also relates to a recombinant adeno-associated virus (AAV) invention also relates to a recombinant linked to an expression control element. The dystrophin minigene in operable linkage with an expression useful for treating Duchenne muscular dystrophy (DMD) and Becker muscular dystrophy (BMD) in a mammalian subject. The present sequence is human dystrophy (BMD) in a mammalian subject. The present sequence is human dystrophy (BMD) and containing nucleotides 1-1668 (N-terminus, dystrophin minigene delta3849 containing nucleotides 1-1668 (N-terminus, and CR domain) and 11047-11058 (dystrophin last 3 amino acids). rod repeats, H1 and H4 domains and a cysteine rich domain of a Example 1; Page 48-49; 71pp; English.

The present invention relates to an isolated nucleotide sequence encoding a dystrophin minigene. The minigene comprises N.terminal or modified N.terminal domains, rod repeats, utrophin or a spectrin gene, HI and H4 domains and cysteine-rich domains of dystrophin or utrophin genes. The comprising dysteine rot a recombinant adeno-associated virus (AAV) element. The dystrophin minigene operably linked to an expression control control element, in a recombinant adeno-associated virus or retrovirus is dystrophy (BMD) in a mammalian subject. The present sequence is AAV vector plasmid construct containing human dystrophy (DMD) and Becker muscular vector plasmid construct containing human dystrophy minigenes, a muscle
                                                                                             spectrin;
                                                                                                                                                                                                                                                                                                                                                                                                               New dystrophin minigene for treating Duchenne or Becker muscular dystrophy comprises an N-terminal domain or modified N-terminal domain, rod repeats, H1 and H4 domains and a cysteine rich domain of a

New dystrophin minigene for treating Duchenne or Becker muscular dystrophy comprises an N-terminal domain or modified N-terminal domain,

Example 1; Page 68-70; 71pp; English.

The present invention relates to an isolated nucleotide sequence encoding a dystrophin minigene. The minigene comprises N-terminal or modified N-terminal domains, rod repeats, utrophin or a spectrin gene, H1 and H4 domains and cysteine-rich domains of dystrophin or utrophin genes. The invention also relates to a recombinant adeno-associated virus (AAV) comprising dystrophin minigene operably linked to an expression control control element. The dystrophin minigene in operable linkage with an expression control control element, in a recombinant adeno-associated virus or retrovirus is dystrophy (BMD) in a mammalian subject. The present sequence is AAV ector plasmid construct containing human dystrophin minigenes, a cytomegalovirus (CMV) promoter and a small polya signal sequence.

New dystrophin minigene for treating Duchenne or Becker muscular dystrophy comprises an N-terminal domain or modified N-terminal domain, rod repeats, H1 and H4 domains and a cysteine rich domain of a Example 1; Page 46-47; 71pp; English.

The present invention relates to an isolated nucleotide sequence encoding a dystrophin minigene. The minigene comprises N-terminal or modified N-terminal domains, rod repeats, utrophin or a spectrin gene, HI and H4 invention also relates to a recombinant adeno-associated virus (AAV) comprising dystrophin minigene operably linked to an expression control element, The dystrophin minigene operably linked to an expression control control element, in a recombinant adeno-associated virus or retrovirus is useful for treating Duchenne muscular dystrophy (BMD) and Becker muscular dystrophy (BMD) in a mammalian subject. The present sequence is human hinge HI and rods RI and R2), 8059-10227 (rods R22, R23 and R24, hinge H4 and CR domain) and 11047-11058 (dystrophin last 3 amino acids).

The present invention relates to an isolated nucleotide sequence encoding a dystrophin minigene. The minigene comprises N-terminal or modified N-terminal domains, rod repeats, utrophin or a spectrin gene, HI and H4 domains and cysteine-rich domains of dystrophin or utrophin genes. The comprising also relates to a recombinant adeno-associated virus (AAV) invention also relates to a recombinant adeno-associated virus (AAV) comprising dystrophin minigene operably linked to an expression control element. The dystrophin minigene in operable linkage with an expression control element. The dystrophin minigene deno-associated virus or retrovirus is control element, in a recombinant adeno-associated virus or retrovirus dystrophy (BMD) in a mammalian subject. The present sequence is AAV vector plasmid construct containing human dystrophin minigenes, a muscle creatine kinase (MCK) promoter and a small polyA signal sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New dystrophin minigene for treating Duchenne or Becker muscular dystrophy comprises an N-terminal domain or modified N-terminal domain, rod repeats, H1 and H4 domains and a cysteine rich domain of a

The present invention relates to an isolated nucleotide sequence encoding a dystrophin minigene. The minigene comprises N-terminal or modified N-terminal domains, rod repeats, utrophin or a spectrin gene, HI and H4 domains and cysteine-rich domains of dystrophin or utrophin genes. The invention also relates to a recombinant adeno-associated virus (AAV) invention also relates to a recombinant adeno-associated virus (AAV) comprising dystrophin minigene operably linked to an expression control element. The dystrophin minigene in operable linkage with an expression control element, in a recombinant adeno-associated virus or retrovirus is control element, in a recombinant adeno-associated virus or retrovirus dystrophy (BMD) in a mammalian subject. The present sequence is AAV vector plasmid construct containing human dystrophin minigenes, a cytomegalovirus (CMV) promoter and a small polyA signal sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                1861 IGCTGAGGACACATTGCAAGGACACAAGGAGATTTCTAATGATGTGGAAGTGGTGAAAGA 1920

The present invention relates to an isolated nucleotide sequence encoding a dystrophin minigene. The minigene comprises N-terminal or modified N-terminal domains, rod repeats, utrophin or a spectrin gene, HI and H4 domains and cysteinerich domains of dystrophin or utrophin genes. The domains and cysteinerich complexes of dystrophin or utrophin or utrophin genes. The comprising dystrophin minigene operably linked to an expression control element, the dystrophin minigene in operable linkage with an expression control element, in a recombinant adeno-associated virus or retrovirus is control element, in a mammahinant adeno-associated virus or retrovirus is useful for treating Duchenne muscular dystrophy (DMD) and Becker muscular dystrophin minigene delta4173 containing nucleotides 1-1992 (N-terminus, dystrophin minigene delta4173 containing nucleotides 1-1992 (N-terminus, hinge H1 and rods R1, R2 and R3), 8059-10227 (rods R22, R23 and R24, hinge H4 and CR domain) and 11047-11058 (dystrophin last 3 amino acids).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New dystrophin minigene for treating Duchenne or Becker muscular dystrophy comprises an N-terminal domain or modified N-terminal domain, rod repeats, H1 and H4 domains and a cysteine rich domain of a

```

The present invention relates to an isolated nucleotide sequence encoding a dystrophin minigene. The minigene comprises N-terminal or modified N-terminal domains, rod repeats, utrophin or a spectrin gene, H and H4 domains and cysteinerich domains of dystrophin or utrophin genes. The domerine are a recombinant adeno-associated virus (AAV) comprising dystrophin minigene operably linked to an expression control element. The dystrophin minigene in operable linkage with an expression control element, in a recombinant adeno-associated virus or retrovirus is control element, in a mammalian subject. The present sequence is human dystrophy (BMD) in a mammalian subject. The present sequence is human dystrophin minigene deltaisia containing nucleotides 1-1341 (N-terminus, hinge H1 and rod R1), 8059-10227 (rods R22, R23 and R24, hinge H4 and CR domain) and 11047-11058 (dystrophin last 3 amino acids). Sequence 3531 BP; 1071 A; 809 C; 824 G; 827 T; 0 other;

The present invention relates to an isolated nucleotide sequence encoding a dystrophin minigene. The minigene comprises N-terminal or modified domains and domains, rod repeats, utrophin or a spectrin gene, HI and H4 invention also relates to a recombinant adeno-associated virus (AAV) element. The dystrophin minigene operably linked to an expression control control element. The dystrophin minigene in operable linkage with an expression control control element, in a recombinant adeno-associated virus or retrovirus is useful for treating Duchenne muscular dystrophy (BMD) in a mammalian subject. The present sequence is AAV vector plasmid construct containing human dystrophin minigenes, a muscle creatine kinase (MCK) promoter and a small polyA signal sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ij

The present invention relates to an isolated nucleotide sequence encoding a dystrophin minigene. The minigene comprises N·terminal or modified N·terminal domains, rod repeats, utrophin or a spectrin gene, H1 and H4 domains and cysteine-rich domains of dystrophin or utrophin genes. The comprising dystrophin minigene of dystrophin or utrophin genes. The comprising dystrophin minigene operably linked to an expression control control element, in a recombinant adeno-associated virus or retrovirus is dystrophy (BMD) in a mammalian subject. The present sequence is human dystrophin minigene deltasio containing nucleotides 1-1668 (N·terminus, Hinge H1 and rods R1 and R2), 8407-10227 (rods R23 and R24, hinge H4 and CR domain) and 11047-11058 (dystrophin last 3 amino acids).
                                                                                                                                                                                                                                                                                                                        1;

New dystrophin minigene for treating Duchenne or Becker muscular dystrophy comprises an N-terminal domain or modified N-terminal domain, rod repeats, H1 and H4 domains and a cysteine rich domain of a

Example 1; Page 63-65; 71pp; English.

The present invention relates to an isolated nucleotide sequence encoding a dystrophin minigene. The minigene comprises N-terminal or modified N-terminal domains, rod repeats, utrophin or a spectrin gene, HI and H4 domains and cysteine-rich domains of dystrophin or utrophin genes. The invention also relates to a recombinant adeno-associated virus (AAV) element. The dystrophin minigene operably linked to an expression control control element, in a recombinant adeno-associated virus or retrovirus is dystrophy (BMD) in a mammalian subject. The present sequence is AAV vector plasmid construct containing human dystrophy (DMD) and Becker muscular vector plasmid construct containing human dystrophin minigenes, a muscle creatine kinase (MCK) promoter and a small polyA signal sequence.

The present invention relates to an isolated nucleotide sequence encoding a dystrophin minigene. The minigene comprises N-terminal or modified N-terminal domains, rod repeats, utrophin or a spectrin gene, HI and H4 domains and cysteine-rich domains of dystrophin or utrophin genes. The invention also relates to a recombinant adeno-associated virus (AAV) invention also relates to a recombinant adeno-associated virus (AAV) element. The dystrophin minigene in operable linkage with an expression control element. The draft in a recombinant adeno-associated virus or retrovirus is control element, in a recombinant adeno-associated virus or retrovirus is useful for treating Duchenne muscular dystrophy (BMD) in a mammalian subject. The present sequence is human dystrophy (BMD) in a mammalian subject. The present sequence is human dystrophin in DNA fragment encoding rods R22, R23 and R24, hinge H4 and
